

Parking lot USB exercise - SDR

Contents	Write 2-3 sentences about the types of information found on this device. • <i>Are there files that can contain PII?</i> ◦ Yes, several files on the drive contain PII, such as a resume, some personal photos and information about a wedding. • <i>Are there sensitive work files?</i> ◦ Yes, although not the greatest threat to the hospital's security, shift schedules and budget sheets were found on the USB. • <i>Is it safe to store personal files with work files?</i> ◦ No, because work files require strict security controls to be handled properly. Mixing of the two may result in confidential information having little to no security when grouped with personal data.
Attacker mindset	Write 2-3 sentences about how this information could be used against Jorge or the hospital. • <i>Could the information be used against other employees?</i> ◦ Yes, information regarding work schedules or budgets could harm other employees, business operations, or reputation. • <i>Could the information be used against relatives?</i> ◦ Yes, if sensitive PII is found in the drive, it could be used to threaten or direct an attack towards individuals mentioned on the drive. • <i>Could the information provide access to the business?</i> ◦ Possibly - if the drive really does belong to a hospital employee, this information could assist a hacker by helping them impersonate the employee. Any kind of elevated privileges or trust as a result would give the malicious actor a significant advantage.

Risk analysis	Write 3 or 4 sentences describing technical, operational, or managerial controls that could mitigate these types of attacks: ● <i>What types of malicious software could be hidden on these devices? What could have happened if the device were infected and discovered by another employee?</i> ○ Software could be hidden on the device that would compromise multiple systems within the network without detection. If an unsuspecting employee plugged in the USB without taking proper precautions, this software could quickly spread through the network and pose a serious security threat to the hospital. ● <i>What sensitive information could a threat actor find on a device like this?</i> ○ They might find sensitive information regarding business operations and security practices, PII, or other miscellaneous information regarding a person's contacts. ● <i>How might that information be used against an individual or an organization?</i> ○ Compromised PII or business operation information could be used to impersonate an authorized user, threaten a system or user, or provide an attack vector to a malicious actor wishing harm towards the hospital.
